The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine. ONS and infilammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to a primer used to a primer is a polypeptides of
                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated NOVX polypeptides and nucleic acid molecules useful for treating, preventing and diagnosing pathological conditions with NOVX-associated disorders, such as cancer, obesity, diabetes and inflammatory or CNS diseases.

The present sequence is that of primer EV976, which was used with primer EV1333 (see ACF05114) in the PCR amplification of a 171 bp fragment corresponding to the 3' end of the long terminal repeats (LTR) of retrovarial vector pEV731. The amplified fragment was used as a probe for genomic DNA extracted from Jurkat cells infected with viral particles containing the HIV-derived vector LTR-Tat-IRES-GFP. The invention provides isolated cells that harbour a latent immunodeficiency virus that is transcription competent, that can be reactivated, and that is an in viro model for latent HIV infection in vivo. The cells are useful for investigating the nature of latency, and also in drug screening assays to identify agents that activate latent HIV. Such agents are useful for reducing the reservoir of latent HIV
immunodeficiency virus e.g. HIV-1, or immunodeficiency virus-based retroviral vector integrated into its genome, useful for identifying latent HIV activators.

lipopolysaccharide induced threonine phosphorylation by a ceramide-activated protein kinase. Novel method of identifying agents capable of inhibiting

Example VII; Col 57; 84pp; English.

The invention relates to a novel method of determining whether an agent is capable of specifically inhibiting the ability of a ceramide-activated protein (CAP) kinase to phosphorylate the threonine residue in a polypeptide containing a Thr-Pro- or Thr-Leu-Pro motif. In particular, the peptide substrate that is specifically phosphorylated is Raf-1, epidermal growth factor receptor (BGFR), or suitable fragments thereof. The CAP kinase is membrane bound and has an apparent molecular weight of

transduction pathway which uses ceramide as a second messenger. This pathway is initiated by tumour necrosis factor-alpha (TNF-alpha) and interior pathway is initiated by tumour necrosis factor-alpha (TNF-alpha) and ceramide. The ceramide in turn stimulates the kinase to phosphorylate protein substrates which can then mediate signal transduction. The CAP kinase is also stimulated by the bacterial endotoxin lippoolysaccharide (LPS), which is thought to mimic the second messenger function of ceramide. The methods are useful for identifying agents that inhibit impoolysaccharide-induced Thr phosphorylation by CAP kinase. The agents identified using the method are useful for treating disorders associated with aberrant phosphorylation of target molecules by CAP kinase, e.g., inflammatory disorders (such as rheumatoid arthritis), ulcerative colitis, graft versus host disease, lupus erythematosus, HIV, infection, disorders associated with poor stem cell growth, and septic shock. the present invention to generate mutant Flag peptide/murine KSR (kinase supressor of ras) sequences via overlap extension PCR. KSR is a homologue 100-110 kD. It is an upstream participant in a sphingomyelin signal kinase

Genetic testing for determining non-responsiveness to statin drug in patients of a coronary artery disease, involves analyzing amplification products for homozygosity for a variant allele in the human lipoprotein lipase gene.

Example 5; Page 26; 74pp; English.

The present invention relates to detecting a genetic predisposition in a human subject for non-responsiveness to statin drug treatment, involving amplifying nucleic acids including a non-coding or untranslated region within the 3' end of the human lipoprotein lipase (LPL) gene from a tissue sample. The method is useful for determining which patients suffering from coronary artery disease, or which coronary artery bypass graft (CABG) patients, will likely not respond positively to statin drug

Human hGT1 PCR primer 1.

```
This invention describes novel human GTI (hGTI) transcription factor gene with neuroleptic activity containing a transcribed polymorphic CAG schedar. Allelic variants of the hGTI gene CAG repeat are associated with schizophrenia, affective disorders (especially manic depression), neurodevelopmental brain diseases or with phenotypic variability with espect to long term response to neuroleptic medication. Short (171-177 bp) allelic variants of CAG repeats in the hGTI gene, are indicative of non-severe schizophrenia and neuroleptic response in patients. Probes and/or primers designed using the hGTI gene can be used to identify genes interacting with a bicchemical pathway affected by the hGTI gene. The identified gene role can then be evaluated in psychiatric patients. The transgenic mammal (or schizophrenic patients) and evaluating the prevention and/or treatment of development of schizophrenia

This invention describes a novel use of nucleic acid (I) that encodes Leishmania kinases (II) for identification and preparation of agents for diagnosis, treatment and/or prevention of leishmaniasis. The invention also describes (a) use of (II) for identifying and producing agents for diagnosis, treatment and/or prevention of leishmaniasis, (b) antibodies (Ab) directed against (II); and (c) Leishmania mutants in which as least one gene (I) is inactivated. (II) are essential for differentiation and replication of the parasites, so are targets for development of specific inhibitors. Mutants defective in (II) induce an immune response but do not cause disease. (I) and (II) are useful for identifying and preparing agents for diagnosis, treatment and/or prevention of protocoal infections, particularly leishmaniasis. (I). (II) and (II)-specific antibodies may themselves be used for diagnosis and treatment. Leishmania mutants that are unable to express at least one (II) are useful as live
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

useful for organ transplantation studies, lot the study of disease disease and for the determination of susceptibility to infectious disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a sequencing primer for Human Leukocyte Antigen (HLA) class I gene. The HLA class I genes are found on chromosome 6p21.3. HLA class I proteins are found on the surface of almost all nucleated cells and are involved in antigen presentation to immune system cells. This primer can be used to type HLA class I genes: by carrying out PCR on a sample DNA, comprising HLA class I gene, and detecting the amplicon formed using a sequence. The present sequence is useful for discriminating among the HLA-B, and HLA-B, and HLA-C genes and other related class I genes and pseudogenes. In addition, the present sequence is useful for organ transplantation studies, for the study of autoimmune disease and for the determination of susceptibility to infectious disease
                                                                                                                                                                                                                                                                                                                         Human Leukocyte Antigen class I; HLA-A; antigen presentation; HLA typing; organ transplantation; autoimmune disease; sequencing primer; infectious disease susceptibility; chromosome 6p21.3; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Typing HLA class I genes for organ transplantation, involves contacting the sample DNA containing HLA class I gene comprising two exons and a target sequence, with amplification primers and detecting the amplicon.
                                                                                                  Gaps

This vector is based on the commercially available vector pRC/RSV. Leader sequences and termination signals were introduced into the vector to allow for production of fusion proteins. The vector, pSfi/Not.Tagl, was modified to replace the pelB leader with the human immunoglobulin VHI leader sequence that permits the encoding of an Sfi cloning site without modification of the amino acid sequence. This fragment was then cloned as an BCoRI/Blunt-HindIII fragment into NotI/Blunt- HindIII cut vector pKC/RSV to give pVACI. The single chain FV for an individual patient can be inserted within the VHI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              leader sequence. This plasmid when encoding a single chain murine antibody/retroviral envelope fusion protein can be used as a plasmid vaccine and it induces a strong humoral response to the antibody moiety in BALB/c mice. (Updated on 25-MAR-2003 to correct PN field.)

Sequencing primers AAT94987-92 were used to sequence PCR amplified human leukocyte antigen (HLA) class I genes. The primers are designed to hybridise to exon-intron borders of exons 2, 3 and 4 of the HLA genes. PCR primers were used for locus specific nucleic acid amplification for HLA typing. Typing HLA-A, -B or -C class I genes comprises providing a sample DNA containing a HLA-A, -B or -C class I gene having a 1st and 2nd exon and a target sequence, contacting the sample DNA with an amplification primer including sequence complementary to sequence located in exon 1 of the HLA-A, -B or -C gene, and a second amplification primer sequence complementary to sequence located in exon 5 of the HLA-A, -B or -C gene, and a second amplification primer equence complementary to sequence located in exon 5 of the HLA-A, -B or -C gene. The PCR product is sequenced using the above primers and the determined DNA sequence compared with the DNA sequences of known HLA Amplification and sequencing primers specific for HLA class 1 genes useful for locus specific nucleic acid amplification for HLA typing Seguence 21 BP; 4 A; 10 C; 2 G; 5 T; 0 U; 0 Other; Parham Claim 10; Page 57; 105pp; English. Primer for sequencing exon 4 antisense strand of HLA class I genes. Human leukocyte antigen-C class I gene; HLA-C; exon 1; exon 5; locus specific nucleic acid amplification; HLA typing; exon 4; ss.

(PEKE) PERKIN-ELMER CORP

Parham P; Johnston-Dow L, Chadwick RB,

The present sequence is a sequencing primer for Human Leukocyte Antigen (HLA) class I gene. The HLA class I genes are found on chromosome 6p21.3. HLA class I proteins are found on the surface of almost all nucleated cells and are involved in antigen presentation to immune system celled. This primer can be used to type HLA class I genes: by carrying out PCR on a sample DNA, comprising HLA class I gene, and detecting the amplicon formed using a sequence-specific detection method e.g. DNA sequencing (using the present sequence). The present sequence is useful for discriminating among the HLA-A, HLA-B, and HLA-C genes and other related class I genes and pseudogenes. In addition, the present sequence is

Claim 39, Col 38; 60pp; English.

Amplification and sequencing primers specific for HLA class 1 genes useful for locus specific nucleic acid amplification for HLA typing.

ö The present sequencing primer was used to sequence PCR amplified human leukocyte antigen (HLA) class I genes. The primer is designed to sequence the antisense strand of exan 4, from the 5, exon-intron border. PCR primers were used for locus specific nucleic acid amplification for HLA typing. Typing HLA-A, -B or -C class I genes comprises providing a sample DNA containing a HLA-A, -B or -C class I gene saving a 1st and 2nd exon and a target sequence, contacting the sample DNA with an amplification primer including sequence complementary to sequence located in exon I of the HLA-A, -B or -C gene, and a second amplification primer sequence complementary to sequence located in exon I of the HLA-A, -B or -C gene, and a second amplification primer sequence The PCR product is sequenced using the above primers and the determined DNA sequence compared with the DNA sequences of known HLA types Human Leukocyte Antigen class I; HLA-A; antigen presentation; HLA typing; organ transplantation; autoimmune disease; sequencing primer; infectious disease susceptibility; chromosome 6p21.3; ss. Typing HIA class I genes for organ transplantation, involves contacting the sample DNA containing HIA class I gene comprising two exons and a target sequence, with amplification primers and detecting the amplicon. The invention describes a new compound, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding CDK9, specifically hybridises with the nucleic acid encoding CDK9 comprising 7018-bp sequence and inhibits expression of CDK9. Also described are: inhibiting the expression of CDK9 in cells or tissues; screening for a modulator of CDK9; a diagnostic method for identifying a disease state; a kit or assay device comprising the compound; and treating an animal having a disease or condition associated with CDK9. The oligonucleotide compound is useful for preparing a composition for treating hyperproliferative disorder, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New oligonucleotide compound that inhibits expression of CDK9, useful for preparing a composition for treating hyperproliferative disorder, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a human cyclin-dependent kinase 9 (CDK9)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a compound targetted to a nucleic acid molecule encoding haematopoietic cell protein tyrosine kinase. The compound inhibits the expression of haematopoietic cell protein tyrosine kinase and it specifically hybridises with the nucleic acid molecule encoding the tyrosine kinase or with at least an 8-nucleobase portion of an active site on the nucleic acid molecule encoding the tyrosine kinase. The attiense compounds are useful for modulating the expression of haematopoietic cell protein tyrosine kinase and treating diseases or conditions associated with the expression of the tyrosine kinase, such as hyperproliferative disorders (e.g. cancer), inflammation, diabetes or a viral infection. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between functions of various members of a biological pathway. The present sequence is human haematopoietic cell tyrosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The sequence represents a human mammary gland enriched chemokine (WEC) sense primer. The primer was used in the invention to generate a fragment encompassing the entire coding region of MEC. The invention relates to a novel method for regulating a tumour or adverse bodily reaction, comprising providing a therapeutic composition having a mammary gland chemokine polypeptide. The polypeptide of the invention has cytostatic and antiinflammatory activity. The method of the invention is useful for regulating a tumour or adverse bodily reaction. The invention also provides a method useful for detecting a tumour using a probe comprising the polymuleotide or an antibody to the MEC. The adverse bodily

The present invention relates to new NoVX polypeptides. The polypeptides, compounded and antibodies are useful in the manufacture of a polymucleotides and antibodies are useful in the manufacture of a medicament for treating or preventing neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's disease, or Huntington's diseases (e.g. Alzheimer's diseases, Parkinson's disease (e.g. acute heart failure, neurological disorders (ardiovascular disease (e.g. acute heart failure, angina pectoris or myocardial infarction), muscular diseases and diseases (including those involving photoreception, deafness and keratinisation disorders), cancer (e.g. ovarian cancer or melanoma), immunological disorders, inflammatory and immune diseases, bacterial, fungal, protozal and viral infections, and reproductive system disorders. The proteins of the invention may be used to screen drugs or compounds that modulate the NOVX protein activity or expression, as well as to treat disorders characterised by insufficient or excessive production of NOVX protein or protein forms that have decreased or aberrant activity compared to NOVX wild type protein, such as diabetes, obseity, metabolic disturbances associated with obseity, anorexia and wasting disorders associated with chronic diseases and various dyslipidaemias. The nucleic acid infectious diseases and various dyslipidaemias. The nucleic acid corrected form minute biological samples (tissue typing), and in formation of mainty appears associated with present mucleic acid sequence represents a probe that was used in the methods of the invention of sequence represents a probe that was used in the methods of the invention of the in

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis compunds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid states and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dottor hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' terminin of mRNA molecules by primer extensions or in screening segments of DNA that have been solutioned and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence and previously sequenced. The sequence containing segments of DNA that have been subclones to this patent can also be obtained in electronic format directly from USPTO at sequence. Then
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

New (beta)-crystalline DNA of a normal golden hamster, useful for treating or preventing various diseases resulting from the abnormality of splicing (e.g., miscarriage).
                                                                                                                                                                                                                                                      The invention relates to a DNA encoding beta-crystalline of a normal golden hamster. The DNA is useful for treating or preventing various disease resulting from the abnormality of splicing (e.g., miscarriage), and to elucidate the cause of the abnormality in the eye ball BIO14.6 hamster which is a model animal of hereditary myocardosis. The DNA enables the elucidation of the cause of the abnormality in eye ball hamster, an molecular machinery related to splicing of the gene in generating mature mRNA. The present sequence represents a golden hamster beta-Bl-crystallin PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; MEC; mammary gland enriched chemokine; chemokine; tumour; cancer; cytostatic; antiinflammatory; inflammation; primer; ss.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Confound the perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, or proposed to genetic variation or in hybridisation to a DNA library, of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of hybridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific.

Content of any gene, in mapping the 5' termin of mRNA molecules by the mittens of any gene, in mapping the 5' termin of mRNA molecules by confinent any sequenced in the microarray. Note: The sequence of acid probes incorporated in the microarray. Note: The sequence of from inspired and previously sequenced in the microarray. Note: The sequence of from inspired the microarray. Note: The sequence of from inspired in the microarray. Note: The sequence of from inspired in the microarray. Note: The sequence of from inspired in the microarray. Note: The sequence of from inspired in the microarray. Note: The sequence of from inspired in the microarray. Note: The sequence of from inspired in the proposed in the microarray. Note: The sequence of from inspired in the microarray. Note: T
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 25 BP; 5 A; 2 C; 6 G; 12 T; 0 U; 0 Other;

EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human; cross-species comparison.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in manitoring gene expression levels by hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at laast one target sequence. The method of analysis comprises of at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, cor family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid forther comprises a tag sequence. The array of nucleic acid forther comprises a tag sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by the additional subclones containing segments of DNA that have been to risolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence. html New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome fg21.3-22.2, MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 15q26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD27, or MD212. The probes are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            present invention relates to novel human zinc finger-containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 1., ____Pred. The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome 7q22.1, MD24 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 16p12 in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic anset on sections in MD23, MD23, MD212 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;

The amplified sequence represents a target for the method of the invention. The specification describes a method for measuring the level of two or more nucleic acid molecules in a target. The method comprises contacting a probe with an arbitrarily or statistically sampled target and detecting the amount of specific binding of the target to the probe. The methods can be used to identify differentially expressed nucleic acid molecules associated with disease states, such as cancer, autoimmune disease, infectious disease, aging, developmental disorder, proliferative disorder or neurological disorder. Also the methods can be used to toxicity of or a resistance to a treatment. Also the methods can be used to determine differential expression of nucleic acid molecules in
conjunctival scarring) or a hyperproliferative disease or condition (e.g. cancer), or in inhibiting the growth of a tumour. This sequence represents a human JNK2 oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     response to a stimulus, e.g. a chemical, drug or growth factor (especially epidermal growth factor), radiation, stress or a pathogen. The methods can also be used to determine co-regulated genes that can be potential targets for drug discovery.

```
proteins and their coding sequences: MD23, MD24, MD212. MD23 is encoded at chromosome 7422.1, MD24 is encoded at chromosome 6p21.3-22.2, encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 16p11.2 and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD21, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

New oligonucleotides, which specifically hybridizes with Jun N-terminal kinase protein, useful in diagnosing or treating inflammation, fibrosis or a fibrotic or hyperproliferative disease or condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an oligonucleotide comprising 8-30 nucleotides
                                               Human, Jun N-terminal kinase, JNK, Jun N-terminal kinase 2; JNK2; hyperproliferative disease; cell cycle progression; protein phosphorylation; tumour growth, cancer; apoptosis; prostate cancer; inflammation; fibrosis; fibrotic disease; scarring; peritoneal adhesion; lung fibrosis; conjunctival scarring; cytostatic;
                             Human Jun N-terminal kinase 2 (JNK2) oligonucleotide #3
                                                                                                                                                                                                                                                                                                                              Nero PS,
                                                                                                                                                                                                                                                                                                                                                                                                            Claim 25; SEQ ID NO 31; 71pp; English.

connected by covalent linkages, where the oligonuclectide has a sequence specifically hybridisable with a nucleic acid encoding a Jun N-terminal kname (JNK) protein and modulates the expression of the JNK protein. The invention also relates to a pharmaceutical composition comprising the oligonucleotide(s) or its bioequivalent and a pharmaceutical carrier, a method of treating an animal having, suspected of having or prone to having a hyperproliferative disease, a method of modulating the expression of a JNK protein in cells or tissues, a method of modulating carlicycle progression, phosphorylation of a protein phosphorylated by a JNK protein and expression of a cellular protein that prometes one or more metastatic events in cultured cells or the cells of an animal, a cell and an animal a method of treating an animal having a disease or condition associated disease or condition characterised by a reduction in apoptosis and composition as condition associated with a JNK protein. The oligonucleotide and composition are useful in classociated with a JNK protein (e.g. prostate cancer), a disease or condition associated with a JNK protein (e.g. prostate cancer), a disease or condition cassociated with a JNK protein (e.g. protein enterpression (e.g. cancer), or in inhibiting the growth of a tumour. This sequence conduction (e.g. cancer), or in inhibiting the growth of a tumour. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1.0%; Score 17; DB 1; Length 20; 100.0%; Pred. The invention relates to an oligonucleotide comprising 8-30 nucleotides connected by covalent linkages, where the oligonucleotide has a sequence specifically pybridisable with a nucleic acid encoding Jun N-terminal kinase (JNK) protein and modulates the expression of the JNK protein. The consolidates to a pharmaceutical composition comprising the coligonucleotide(s) or its bioleguivalent and a pharmaceutical carrier, a method of treating an animal having, suspected of having or prone to having a hyperproliferative disease, a method of modulating the capression of a JNK protein in cells or tissues, a method of modulating cell cycle progression, phosphorylation of a protein phosphorylated by a JNK protein and expression of a cultured cells or the cells of an animal, a method of inhibiting the growth of a tumour in an animal, a method of inhibiting the growth of a tumour in an animal, a method of inhibiting the growth of a tumour in an animal, a method of treating an animal having a disease or condition associated with a JNK protein. The oligonucleotide and composition associated with a JNK protein. The oligonucleotide and composition associated reduction in apoptosis (e.g. prostate cancer), a disease or condition characterised by a ceduction in apoptosis (e.g. prostate cancer), a disease or condition associated associated with a JNK protein (e.g. scarring, peritoneal adhesions, lung fibrosis, disease or condition (e.g. scarring, peritoneal adhesions, lung fibrosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New oligonucleotides, which specifically hybridizes with Jun N-terminal kinase protein, useful in diagnosing or treating inflammation, fibrosis or a fibrotic or hyperproliferative disease or condition.
                                                                                                                                                                                                                                                                                             hyperproliferative disease; cell cycle progression; protein phosphorylation; tumour growth; cancer; apoptosis; protein cancer; inflammation; fibrosis; fibrotic disease; scarring; peritoneal adhesion; lung fibrosis; conjunctival scarring; cytostatic; antiinflammatory; vulnerary; ss.

inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid

```
promotes one or more metastatic events in cultured cells or the cells of an animal) by administering the oligonuclectide to the cells, inhibiting the growth of a tumour in an animal by administering the oligonuclectide to the cells, inhibiting the growth of a tumour in an animal by administering the oligonuclectide in a cell by contacting a cell with an AS oligonuclectide for JNK2 and treating a human having a disease or condition associated with a JNK protein or characterised by a reduction in apoptosis by administering to reduction the associated with a JNK protein contaction characterised by a reduction in apoptosis, such as a disease or condition characterised by a reduction in apoptosis, such as prostate cancer or prostate tumour, inflammation, fibrosis or fibrotic disease or condition (e.g. fibrotic scarring), hyperproliferative disease or condition, such as cancer. The antisense oligonuclectides may also be used as research agents and diagnostic aids, to detect the presence of JNK protein-specific nucleic acids in a cell or tissue sample, and to study the function of one or more genes in the animal. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunostimulatory, antiinflammatory, dermatological, antipsoriatic, antiulcer; gene therapy, vaccine; non-allergic inflammatory disease, psoriasis; eczema; allergic contact dermatitis; latex dermatitis; inflammatory bowel disease; ulcerative colitis; Crohn's disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Treating non-allergic inflammatory diseases, such as psoriasis, ecz
allergic contact dermatitis, latex dermatitis or inflammatory bowel

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Gaarde WA;

The invention relates to an oligonucleotide (antisense, AS) comprising 830 nucleotides connected by covalent linkages, where the oligonucleotide
has a sequence specifically hybridisable with a nucleic acid encoding a
Jun N-terminal kinase (JMK) protein and modulates the expression of the
Jun N-terminal kinase (JMK) protein and modulates the expression of the
Jun N-terminal kinase (JMK) protein and modulates the expression of the
CC JUN protein. Also included are a pharmaceutical composition comprising
CC carrier), treating an animal having/suspected of having/prone to having a
CC carrier), treating an animal having/suspected of having/prone to having a
CC carrier), treating an animal having lengthed to a prophylactic or
CC therapeutic amount of the composition of the AS oligonucleotide,
modulating the cells or tissues with the AS oligonucleotide,
modulating the cells or tissues with the AS oligonucleotide,
contacting the cells or tissues with the AS oligonucleotide,
modulating the cells or tissues with the AS oligonucleotide,
contacting the cells or tissues with the AS oligonucleotide,
modulating
contacting the cells or the phosphorylation of a protein that
contacting apoptosis in a call by contacting a cell with an AS
condition associated with a JMK protein or characterised by a reduction
condition associated with a JMK protein or characterised by a reduction
in apoptosis by administering a prophylactic or therapeutic amount of the
AS oligonucleotide. The antisense oligonucleotide is useful for treating
a disease or condition characterised by a reduction in apoptosis, such as
prostate cancer or prostate tumour, inflammation, fibrosis or conjunctival scarring, hyperproliferative disease or
condition, such as cancer. The antisense oligonucleotides may also be
condition, such as cancer. The antisense oligonucleotide such as the function of one or more genes in the new of the constitution of the one or more genes in the nimal. The present sequence is a sense control oligonucleotide for antisense oligonucleotides targeting a human JNK.

The invention relates to inhibiting angiogenesis in a subject, comprising administeraring at least one antianglogenic mucleic acid molecule. Also included is a kit comprising a first container housing the antianglogenic mucleic acids, and instructions for administering them to a subject mucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, corneal graft rejection, neovascular glaucoma, retrolental fibroplasis, rubocais, Osler Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                        Angiogenesis inhibitor; ss; angiogenesis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiectasia; haemophiliac joint; angiofibroma; wound gramulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, oesophageal cancer, colon and rectum cancer, larynx cancer, leukaemia, liver cancer, lung cancer, kidney cancer, larynx cancer, leukaemia, liver cancer, lung cancer, kidney cancer, larynx cancer, pancreatic cancer, prostate cancer, rabadomyosarcoma, skin cancer, stomach cancer, testicular cancer, rabadomyosarcoma, skin cancer, stomach cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the

     nucleotide encoding a Jun N-terminal kinase (JNK2) protein, resulting in decrease of JNX2 expression and leading to induction of apoptosis. The present sequence is one such antisense oligonucleotide. The oligonucleotides of the present invention are useful for treating diseases or conditions with reduced apoptosis, e.g. cancer and cellular hyperproliferation. The oligonucleotides may also be used to increase the stimulation of apoptotic proteins, e.g. for treating Alzheimer's or Parkinson's disease, amylotrophic lateral sclerals, retinitis,
                                                                                                        pigmentosa, epilepsy, mycardial infarction, stroke, obstructive jaundice, polycystic kidney and diabetes. The present sequence may have a phosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note= "This oligonucleotide is a 2'-O-methoxyethyl (MOE) chimeric antisense oligonucleotide containing five MOE/phoshopdiester residues flanking a 2'-deoxymucleotide/phosphorothioate region"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tunnour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Thi immune response and to activate immune cells. Note: the

The present invention relates to antisense oligonucleotides (AAC62844-C63000, AAA6099-A96099 and AAA0799) that hybridise specifically to a nucleotide encoding a Jun N-terminal kinase (JMK2) protein, resulting in decrease of JMK2 expression and leading to induction of apoptosis. The present sequence is one such antisense oligonucleotide. The oligonucleotides of the present invention are useful for treating diseases or conditions with reduced apoptosis, e.g. cancer and cellular hyperproliferation. The oligonucleotides may also be used to increase the stimulation of apoptotic proteins, e.g. for treating Alzheimer's or Parkinson's disease, amylotrophic lateral sclerosis, retinitis, pigmentosa, epilepsy, myocardial infarction, stroke, obstructive phosphorothioate backbone
                                                                      Novel methods for reducing apoptosis comprising contacting cells with antisense oligonucleotides, useful for treating apoptotic disorders, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel methods for reducing apoptosis comprising contacting cells with antisense oligonucleotides, useful for treating apoptotic disorders, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense, gene therapy, JNK2 protein, apoptosis, cancer, cellular hyperproliteration, Alzeimer, si Parkinson's disease, amylotrophic lateral scletosis, retinitis, pigmentosa, epilepsy, myocardial infarction, stroke, obstructive jaundice, polycystic kidney,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             à
                                                                                                                                                                                                                                                                                                                                                                                                                attisense inhibition of a tumour necrosis factor (TNF) alpha signalling molecule. In the method TNF alpha signalling molecules Ha-ras, c-raf and c-Jun N-terminal kinase (UNK)2 were inhibited by antisense clustense oligomucleotides. In addition an antisense oligomucleotide to the cell adhesion molecule E-selectin was also examined. The present sequence is the UNK2 antisense oligomucleotide. The antisense oligomucleotides used in the method contained modifications, namely phosphorothicate linkages and 2 methoxyethoxy bases. Some C residues also had a 5 methyl and 2 methoxyethoxy bases. Some C residues also had a 5 methyl cantinhicate inhibitors of the TNF alpha signalling molecules have antibhacterial immunosuppressive, antiphosoriatic, antidabetic, antithyroid, cytostatic, dermatological, antiallergic and antithifammatory activity. The antisense inhibitors may be useful for the treatment of sepsis, rheumatoid arthritis, inflammatory will immune disease, allergic contact dermatitis, psoriasis, inflammatory bowel disease, allergic contact dermatitis, psoriasis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                      New antisense oligonucleotides that detect and modulate the expression of Jun N-terminal kinase proteins - useful for treating hyperproliferative diseases and inhibiting tumor growth in animals, and for modulating protein phosphorylation by these proteins.
                                                                                                                                                                                           The invention relates to antisense oligonucleotides that detect and modulate the expression of Jun N-terminal kinase (JNK) proteins. The oligonucleotides specifically hybridize to a nucleic acid encoding a JNK1, JNK2 or JNK3 protein, and which modulate expression of these proteins. The oligonucleotides are useful for modulating JNK protein. The oligonucleotides are useful for modulating JNK protein. The oligonucleotides are also useful for modulating the phosphorylation of a protein that has been phosphorylated by a JNK protein, and the expression of a cellular protein that promotes one or more metastatic events. The oligonucleotides also form pharmaceutical compositions for treating animals with a hyperproliferative disease, and for inhibiting tumor growth in an animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense oligonucleotide; Jun N-terminal kinase; JNK; hybridise; JNK1; JNK2; JNK3; cell cycle progression; phosphorylation; tumour; probe; hyperproliferative disease; human; ss.

antisense oligonucleotides that detect and modulate the expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            tumour necrosis factor alpha; phosphorothioate; methoxyethoxy; sepsis; rheumatoid arthritis; inflammatory; immune disease; inflammatory bowel disease; allergic contact dermatitis; psoriasis; disease; allogret rejection; cancer; antibacterial; immunosuppressive; antipsoriatic; antidiabetic; antithyroid; cytostatic; dermatological; antiallergic; Ha-ras; c-raf; c-Jun N-terminal kinase;
                    Jun N-terminal kinase proteins - useful for treating hyperproliferative diseases and inhibiting tumor growth in animals, and for modulating protein phosphorylation by these proteins.
                                                                                                                                                                                            The invention relates to antisense oligonucleotides that detect and modulate the expression of Jun N-terminal kinase (JMK) proteins. The oligonucleotides specifically hybridize to a nucleic acid encoding a JMK1, JMK2 or JMK3 protein, and which modulate expression of these expression and cell cycle progression in cultured cells or animal cells repression and cell cycle progression in cultured cells or animal cells. The oligonucleotides are also useful for modulating the phosphorylation of a protein that has been phosphorylated by a JMK protein, and the expression of a cellular protein that promotes one or more metastatic events. The oligonucleotides also form pharmaceutical compositions for treating animals with a hyperprollferative disease, and for inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  U
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          are 2'-methoxyethoxy, additionally C

sickle cell retinopathy; ss.

```
The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (1). (I) can have antiposoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, cytostatic, antiseborrheic, antidiabetic, and cleaves RNA encoding (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, cyquences ruch as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing processor scarting such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57577 to AAH62099 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                            Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises computing probes are target neor more nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring core family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid brobes is useful in in situ hybridisation, in Southern, Northern or dotbothy brimes attached to dentify or detect the sequence or specific mattations of any gene, in mapping the 5' termin of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones containing sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence of data for this patent can also be obtained in electronic format directly from inspendent the microarray. Note: The sequence of the form inspendent and also consequence the microarray. Note: The sequence of the format directly and senders and second processes in the microarray. Note: The sequence of the form inspendent and previously sequence or specific and areadata many conclusing the microarray. Note: The sequence of the form inspendent and also conclused the microarray. Note: The sequence of the form inspendent and previously sequence or specific and areadata many conclusing the sequence or specific and areadata many conclusing the sequence 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense oligonucleotide; Jun N-terminal kinase; JNK; hybridise; JNKl; JNK2; JNK3; cell cycle progression; phosphorylation; tumour; probe; hyperproliferative disease; human; ss.
                                                                                                                                                                                                                                                                                                                      New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

Representative examples of ribozyme recognition sites are given in AAA88415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                 Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                     New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDKI, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cell-cycle dependent kinase cdk3 ribozyme binding site SEQ ID NO:343.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [II] comprising a promoter operably linked to a nucleic acid segment encoding [I]. (I) can have antipsoriatic, cophthalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermaticis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing carring such as keloid, adhesion and hypertrophic or hypertrophic burn secur. AMMSTOTY to AMH62099 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; antipsoriatic; dermatological; antiesborrheic; antidiabetic; virucide; antisickling; ophthalmological; scarcioltic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; seborrheic wart; vitreoretinopathy; scar;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cell-cycle dependent kinase cdk3 ribozyme binding site SEQ ID NO:347.

Query Match

The invention relates to 566 new isolated human polypeptides and their encoding genes, sequences that are at least 95% identical to these or sequences comprising one or more conservative substitutions in these. The polypeptide, polynucleotide and antibodies against the polypeptides are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, diabetes, AIDS, multiple sclerosis, graft-versus-host disease, Alzheimer's disease, Parkinson's disease, asthma, or fertility disorders.

The nucleic acids are further used as hybridization probes, in chromosome ampping, tissue typing, preventive medicine, and pharmacogenomics. The polypeptides are also useful as vaccines. This sequence represents an example of a probe used to isolate the nucleic acid sequences of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in RAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                       Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss

New polypeptides, designated NOVX polypeptides, useful for treating hemophilia, idiopathic thrombocytopenic purpura, autoimmune disease, allergies, transplantation, Alzheimer's disease and stroke.

Example C; Page 264; 320pp; English.

The invention relates to an isolated NOVX polypeptide selected from NOV1-NOV27 polypeptides, a mature form of NOVX, a variant of NOVX or a fragment of NOVX. Also included are determining the presence or amount of NOVX in a sample (by using an antibody that immunospecifically bind to the polypeptide), determining the presence of or predisposition to disease associated with altered levels of NOVX in a first mammalian subject, identifying a potential therapeutic agent for use in the treatment of pathology related to aberrant expression of physiological interactions of NOVX, screening for a modulator of activity or of latency or predisposition to a pathology associated with NOVX, the nucleic acid encoding NOVX, vectors and host cells. NOVX is useful for identifying an agent (a cellular receptor or downstream effector) that binds to NOVX. NOVX and NOVX and NOVX nucleic acids are useful for treating or preventing NOVX-

for treating a NOVX related disease human disease e.g.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect march, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acids to at least two or more nucleic acids probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of muRh molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly Seguence 25 BP; 4 A; 4 C; 7 G; 10 T; 0 U; 0 Other; from USPTO at segdata.uspto.goc/sequence.html

Human gene specific PCR primer #960.

Primer; ss; DNA microarray; differential expression analysis; human.

```
acids (NAs) comprising contacting a sample from a physiological acids (NAs) comprising contacting a NA sample from a physiological source, with a pool of 50 distinct gene specific primers under suitable conditions to enzymatically generate sub-population of NAs, where each gene specific primer has a sequence complementary to a distinct mRNA, and each labeled NA is generated using a sub-population of labeled NAs which is useful for analysing the differences in the RNA profiles between several different physiological sources, where the method comprises producing comprising the populations for the different physiological sources, comprising the population, where the comparison is preferably differences in the population, where the comparison is preferably comprising the patterns for each of the distinct to physiological sources to an array of probe NAs stably associated with the surface of a substrate to produce a hybridisation pattern for each of the sources, where differential gene expression assays are utilised in differential contaction analysis of diseased a normal tissue e.g. neoplastic a normal cissue, or different tissue or subsistence is a human gene specific PCR primer used in the method of the invention. Note: The sequence data for this patent of id not form part of the printed produced the contact of the printed periodical sources.
                                                                                                                                                                                                                                                                                                                                                    Producing sub-population of labeled nucleic acids, useful for analyzing differences in RNA profiles between several different physiological sources, using set of distinct gene specific primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, ss; NOVX; adrenoleukodystrophy; haemophilia; stoke; VHL; PCR; congenital adrenal hyperplasia; haemophilia; hypercoagulation; idiopathic thrombocytopaenic purpura; autoimmune disease; altergy; immunodeficiencies; transplantation; Von Hippel-Lindau syndrome; Alzheimer's disease; tuburous sclerosis; Parkinson's disease; epilepsy;

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of the and disorder associated with decreased expression or activity of human functions are also as the second of activity of human functions are also as the second of activity of human functions are also as the second of activity of human functions are also as the second of activity of human functions are also as the second of activity of human and a second or activity of human functions are also as the second of a second or activity of the second of the second or activity of the second or activity of the second or activity of clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, an analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target of more nucleic acids to a least two or more nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring pene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Bach of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dot-blot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at segdata.uspto.goc/seguence.html data for this patent can also be

Human microarray DNA oligonucleotide SEQ ID NO 83985. 14-OCT-2003 (first entry)

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and/or amount specifically of hOBMLP proteins, as specific blomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; SEQ ID NO 15296; 214pp; English.

(first entry) 03-JAN-2003 ABV82337;

Human HTPL scanning oligonucleotide SEQ ID 3583.

Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1;

Human HTPL scanning oligonucleotide SEQ ID 3580.

03-JAN-2003 (first entry)

```
The present invention relates to human testis expressed Patched like protein (HTPL, see ABY78759 to ABY78762 and ABB98519 to ABB98520). HTPL brotein (HTPL, see ABY78759 to ABY78762 and ABB98519 to ABB98520). HTPL brotein (HTPL, see ABY78759 to ABY78762 and ABB98519 to ABB98520). HTPL chas two isoforms, with a few single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ call development, and the HTPL gene was mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in the such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and such disorder bone marrow, brain, kidney, lung, placenta, prostate, skeletal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potential therapeutic acids are assemble from the infertility and cancer. The present oligomucleotide was used in an example from the present oligomucleotide was used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 2; Page 533; 718pp; English

                                                                                                                                                                            This oligonucleotide was designed to amplify the region of homology in the kinase domains of PDGF receptor, HER2, HER3, FGF-FLG, FGF-BEK, insulin receptor and IRR. It was used with another kinase homology domain -based primer (see AAV05314) in the amplification of human LIM-kinase 1 (LIMX1) sequences. The LIMX1 game is composed of 16 exons (see AAV05315 and AAT99599-T99629) and is located 15.4 kb 3' of elastin in chromosome
                                                                                                                                                                                                                                                          the LIMK1
                                                                                                 Diagnosing Williams syndrome cognitive profile from hemi-zygosity of LIMX1 - gene on chromosome 7 encoding new kinase, allowing differentiation from classic Williams syndrome and supra-vascular aortic
                                                                                                                                                                                                                                             7. It encodes a novel protein kinase (see AAW46576). Williams syndrome cognitive profile (WSCP) is detected by determining zygosity of the LIV locus, with hemizygosity being indicative of impaired visuo-spatial constructive cognition. Chromosome 7 deletion analysis allows discrimination between WSCP, SVAS (supra-vascular aortic stenosis) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

used as immunogens to raise antibodies that specifically recognise homologue and or amount specifically recognise homologue and/or amount specifically of homologue proteins, as specific biomolecule capture probes for surface-enhanced last described in ionisation, as therapeutic supplement in patients having specific deficiency in homolocule production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding homolocule may be used for diagnosing a disorder associated with the expression of homolocule, in particular heart and skeletal muscle disorders. homologuer used in the screening of the homolocule sequence represents an oligomer used in the screening of the homolocule associated for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a human genome-derived myosin-like protein and polynuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
                                                                                                                                                                                                                                                                                                                                                                                                                                   New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

This invention relates to a novel method for generating histocompatible tissues for transplantation and cell therapy using nuclear transplantation cloning. Specifically, it refers to producing tissue engineered constructs with a desired genetic type, which comprises contacting either the inner cell mass, morula, embryonic stem (ES) cell, adult stem cell or desired differentiated cell with a matrix that adult stem cell or desired differentiated cell with a matrix that call therapy. The present invention describes a method of therapeutic cell therapy. The present invention describes a method of therapeutic cloning transgenic mammalian tissue, preferably human. As such, it can be used for the treatment of cancer, burns, heart disease, diabetes, AIDS, liver, skin or corneal disease, as well as spinal cord injury, multiple sclerosis and reproductive or auditory dysfunction. Accordingly, these scherosisticns exhibit cytostatic, dermatological, vulnerary, immunosuppressive, nootropic, antidiabetic, hepatotropic and nemplify AQPI cDNA for tubule tissue of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô

This antisense oligonucleotide is nuclease resistant and can be used in the treatment of animals, including humans, having a bacterial infection. The treatment comprises administration of such nuclease resistant oligonucleotides, targeted to a nucleic acid or protein of the bacterium, and formulated with a carrier. A compound comprising this nuclease cresistant oligonucleotide can be covalently linked to an antibiotic. The method is used to treat infections by a wide variety of Gram-positive and Gram-negative, or acid-fast, bacteria, in human and veterinary medicine. The methods are particularly used in immuno-compromised individuals (e.g. patients with acquired immunodeficiency syndrome or those receiving chemotherapy or radiation therapy), optionally in combination with, or therapeutic use, the oligonucleotides can be used to control bacteria in taboratory cultures, foods, beverages and industrial processes. The oligonucleotides are specific for bacteria, without affecting metabolism con mammalian cells. They may also activate Rhase H and have a general, one specific immune-stimulating effect. The oligonucleotides can be administered orally, intranasally, rectally, topically or by injection, and an agent (e.g. carbohydrate or polyamine) that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Williams syndrome cognitive profile; WSCP; cognition; LIM-kinase 1; LIMK1 gene; supra-vascular aortic stenosis; protein kinase; human; PCR;
                                                                                                                                                                                                           Treating bacterial infections in humans or animals with oligo:nucleotide(s) - resistant to nuclease and targetted to bacterial nucleic acid or proteins, also conjugates of these oligo:nucleotide(s) with antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

This can be used to determine the best treatment for eancers, in particular neural cell, lung and prostate tumours. The present sequence is a PCR primer useful for detecting the coding sequences of markers of the invention
The sequence represents a human mammary gland enriched chemokine (MEC) PCR primer. The primer was used in the invention to amplify the coding region of MECR. The invention relates to a novel method for regulating a tumour or adverse bodily reaction, comprising providing a therapeutic composition having a mammary gland chemokine polypeptide. The polypeptide of the invention has cytostatic and antiinflammatory activity. The method of the invention is useful for regulating a tumour or adverse bodily reaction. The invention also provides a method useful for detecting a tumour using a probe comprising the polymolectide or an antibody to the MEC. The adverse bodily reactions include cancer and inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining the presence of neoplastic molecular markers, by identifying the presence of markers in host test sample using array of neoplastic molecular marker specific reagents and analyzing the array of the

The present invention provides methods and compositions for supplementing or replacing a damaged organ such as kidney, heart, liver, spleen, pancreas, bladder, ureter and urethra. The present sequence is AQPI CDNA amplifying PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCR; primer, ss; histocompatible tissue; cell therapy; nuclear transplantation cloning; matrix; therapeutic cloning; regenerative therapy; transgenic; cancer; burn; heart disease; diabetes; AIDS; liver; skin; corneal disease; spinal cord injury; multiple sclerosis; reproductive; auditory dysfunction; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New tissue-engineered construct comprising differentiated cells on a three-dimensional biocompatible scaffold, and at least one physiological function of the organ, useful for supplementing or replacing a damaged
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL. Example 2; Page 533; 718pp; English

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome loppi2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorders sinclude disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention

Claim 1; SEQ ID NO 102019; 9pp; English

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in manitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic acid probes are specifically designed for analysis compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotor blot hybridisation to identify or detect the sequence or specific or mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones of mucleic acid probes incorporated in the microarray. Note: The sequence chara for this patent can also be obtained in electronic format directly contactly contactly and sequence or the sequence of the nucleic acid probes incorporated in the microarray.               I can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates on provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 herapeutic supplement in patients having specific deficiency in hGDMLP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and
                                                                                                                                                                                                                             production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
polynucleotide sequences of hGDMLP-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL constraints, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL codon shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is comportant in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10pl2.1 HTPL and it for diagnosing a disorder caused by mutation in HTPL, and in chromosome 10pl2.1 HTPL and it for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and codetal liver, bone matrow, brain, kidney, placenta, prostate, codetal liver, bone matrow, brain, kidney, placenta, prostate, codetal liver, bone matrow, brain, kidney, placenta, prostate, codetal muscle or colon function. HTPL proteins and nucleic acids are colinicatly undergenere. The present oligonucleotide was used in an anamale from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..

                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                           The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its cerfect match, perfect mismatch, antisense match or antisense mismacch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, or in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of hybridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the concleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid concleic acids further comprises a tag sequence. The array of nucleic acid concleic acid dentify or detect the sequence or specific or mutations of any gene, in mapping the 5' termin of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones or containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the concleic acid probes incorporated in the microarray. Note: The sequence or profectly form these parts of an also be obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                            New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,
                                                                                                                                          The present invention relates to probes which can be used for the measurement of an enzyme. The probes can be used for the measurement of an enzyme participating to the first phase reaction of drug metabolism. The present sequence is a probe shown in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.
to the first phase reaction of it.
                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human GDMLP-1 25-mer scanning SEQ ID NO:5 sequence SEQ ID NO:15295.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a human genome-derived myosin-like

                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                       The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding cyclindependent kinase 4. specifically hybridises with the nucleic acid encoding cyclin-dependent kinase 4 and inhibits expression of cyclindependent kinase 4. The antisense oligonucleotide is useful for preparing dependent kinase 4. The antisense oligonucleotide is useful for preparing disorder, e.g., cancer. This sequence represents a human cyclin dependent kinase 4 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /mod_base= OTHER

The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding cyclindependent kinase 4, specifically hybridises with the nucleic acid encoding cyclin-dependent kinase 4 and inhibits expression of cyclindependent kinase 4. The antisense oligonucleotide is useful for preparing a composition for treating diabetes, infertility or hyperproliferative disorder, e.g., cancer. This sequence represents a human cyclin dependent kinase 4 antisense oligonucleotide.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [11] comprising a promoter operably linked to a nucleic acid segment encoding [1]. [1] can have antipsoriatic, attistickling, certacological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. [1] can be used in gene therapy. [1] and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinal detechment, and for treating and preventing province or prematurity and retinal detechment, and for treating and preventing contactions and contacting and preventing and contacting and preventing and contacting and preventing and contacting an
                                                                                                                                                                                                                                                                                                                                                         Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      or hypertrophic burn

                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to antisense compounds, compositions and methods for modulating the expression of PCTAIRE protein kinase 1 (also known as PCTAIRE-1, PTCK1 and crk5). The antisense oligonucleotide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinase 1, particularly a hyperproliferative disease or a meurological disease. These diseases include thrombocycopaenia, mental retardation, Wiskott-Aldrich syndrome, retinitis pigmentosa, dystonia with Parkinsonism, sideroblastic anaemia, X-linked Charcot-Marie-Tooth disease, or incontinentia pigmenti. The antisense oligonucleotide is particularly useful for inhibiting the expression of PCTAIRE protein kinase 1 in cells or tissues. It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is human PCTAIRE
                                                                                                                                                                                                                                                                                                                                    New antisense oligonucleotides for modulating PCTAIRE protein kinase 1 gene expression, particularly useful for treating hyperproliferative or neurological disorders for example, mental retardation, or

```
The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid melecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (1). (1) can have antipsoriatic, copthalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, copathalmological, vulnerary, keratolytic and vincide activities, and cleaves RNA encoding cytokine involved in inflammation. (1) can be used in gene therapy. (1) and (II) are useful for treating proliferative skin diseases such as positiasis, atopic dermaticis, actinic keratosis.

Squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing carring such as keloid, adhesion and hypertrophic or hypertrophic burn the scarring such as keloid, adhesion and hypertrophic or hypertrophic burn the
                                                                                                                                                                                                                                                                                                      Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1.1%; Score 19; DB 1; Length 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MWP; antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keraclolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar; sickle cell retinopathy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CNK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                    Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

```
in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dottor hybridisation to identify or detect the sequence or specific autations of any gene, in mapping the 5° termini of mRNA molecules by primer extensions of any gene, in screening segments of DNA that have been solones for additional subclones containing segments of DNA that have been nucleic acid probes incorporated in the microarray. Note: The sequence date from USPFO at seqdata.uspto.goc/sequence.html

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1. PCNA and Cyclin B1.
Representative examples of ilbozyme recognition sites are given in AAA82115 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                    Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.

coupled to an exogenous promoter; is at least 30 contiguous bases of a sequence of 2556 bp, fully defined in the specification and is attached to a solid support; is the 2556bp polymucleotide or its modified form; or is a sequence of 2367 bp, fully defined in the specification; a recombinant cell comprising the recombinant nucleic acid, where the cell comprises an RNA polymerase recognised by the promoter; a recombinant cell made by introducing into a murine callular genome a recombinant nucleic acid encoding at least 20 contiguous amino acids of the 851 amino acid protein; a purified antibody preparation comprising an antibody that selectively binds to the polypeptide over the human disrupted-in-schizophrenia 1 polypeptide; a recombinant mouse comprising an alteration in an allele encoding a polypeptide over the human disrupted-in-schizophrenia a polypeptide, where the alteration substantially reduces or increases full length expression of the polypeptide from the polypeptide by contexting the Disc1 polypeptide with the compound; and measuring the ability of the compound to bind to the Disc1 polypeptide. The disrupted-in-schizophrenia 1 protein has neuroleptic, nootropic, and neuroprotective activities. The Disc1 polypeptides are useful for treating sections and neurophymenia major mental linesses, schizophrenia schizophren
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 disorders or unipolar disorders. This polynucleotide sequence represents a splice donor site of the disrupted-in-schizophrenia 1 (Disc 1) gene of

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 51207; 9pp; English.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its

```
perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termin of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used
                                                                                                                                                                                                                                                                                                                                                        for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at seqdata.uspto.goc/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the

The invention relates to antisense compounds, compositions and methods for modulating the expression of PCTAIRE protein kinase I (also known as PCTAIRE-1, PTCK1 and crk5). The antisense oligonucleotide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinase I, particularly a hyperproliferative disease or a neurological disease. These diseases include thrombocytopaenia, mental retardation, Wiskott-Addrich syndrome, retinitis pigmentosa, dystonia with Parkinsonias, sideroblastic anaemia, X-linked Charcot-Marie-Tooth disease, or incontinentia pigmenti. The antisense oligonucleotide is particularly useful for inhibiting the expression of PCTAIRE protein kinase I in cells or tissues: It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targeted to human PCTAIRE protein kinase I DNA. This sequence is used to illustrate the method of the invention

New Disc1 polypeptides, useful for treating schizophrenia, major mental illnesses, schizoaffective disorders, bipolar disorders or unipolar

Disclosure; SEQ ID NO 20; 57pp; English.

The invention relates to a novel purified disrupted-in-schizophrenia 1 (Disc 1) polypeptide comprising at least 8 contiguous amino acids of a sequence of 851 amino acids, fully defined in the specification. The invention further relates to: a recombinant nucleic acid comprising a sequence that either encodes the polypeptide and is transcriptionally coupled to an exogenous promoter, is at least 30 contiguous bases of a sequence of 2556 bp, fully defined in the specification and is attached to a solid support; is the 2556bp polymucleotide or its modified form; or is a sequence of 2367 bp, fully defined in the specification; a

comprises an RNA polymerase recombinant nucleic acid, where the cell comprises an RNA polymerase recombinant cellular genome a recombinant nucleic acid protein; a purified antibod a murine cellular genome a recombinant nucleic acid encoding at least 20 contiguous amino acids of the B51 amino acid protein; a purified antibody preparation comprising an antibody that selectively binds to the polypeptide over the human disrupted-inschizophrenial polypeptide, a recombinant mouse comprising an alteration in an allele encoding a polypeptide, where the alteration substantially reduces or increases full length expression of the polypeptide from the polypeptide by contacting the Discl polypeptide with the compound able to bind to a Discle polypeptide by contacting the compound to bind to the Discl polypeptide. The disrupted-in-schizophrenia | protein has neuroleptic, noctropic, and neuroprotective activities. The Disc | polymucleotide can be used in gene therapy to treat disorders. The polypeptides are useful for treating schizophrenia, major mental illnesses, schizoaffective disorders, bipolar disorders or unipolar disorders. This polynucleotide sequence represents a splice acceptor site of the disrupted-in-schizophrenia 1 (Disc 1) gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to antisense compounds, compositions and methods for modulating the expression of PCTAIRE protein kinase 1 (also known as PCTAIRE-1, PTCK1 and crk5). The antisense oligonucleotide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinase 1, particularly a hyperproliferative disease or a neurological disease. These diseases include thrombocytopaenia, mental retardation, Wiskott-Aldrich syndrome, retinitis pigmentosa, dystonia with Parkinsonism, sideroblastic anaemia, X-linked Charcot-Marie-Tooth

                      particularly useful for inhibiting the expression of FCTAIRE protein kinase i in cells or tissues. It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PCTAIRE protein kinase 1 DNA. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ı

New antisense oligonucleotides for modulating PCTAIRE protein kinase 1 gene expression, particularly useful for treating hyperproliferative or neurological disorders for example, mental retardation, or

The invention relates to antisense compounds, compositions and methods for modularing the expression of PCTAIRE protein kinase 1 (also known as PCTAIRE-1, PTCK1 and crk5). The antisense oligonucleotide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinse 1, particularly a hyperproliferative disease or a neurological disease. These diseases include thrombocytopaenia, mental retardation, Wiskott-Aldrich syndrome, retinitis pigmentosa, dystonia with Parkinsonism, sideroblastic anaemia, X-linked Charcot-Marie-Tooth disease, or incontinentia pigmenti. The antisense oligomucleotide is particularly useful for inhibiting the expression of PCTAIRE protein kinase 1 in cells or tissues. It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is an antisense eotide targetted to human PCTAIRE protein kinase 1 DNA. This is used to illustrate the method of the invention oligonucleotide

disease, or incontinentia pigmenti. The antisense oligonucleotide is particularly useful for inhibiting the expression of PCTAIRE protein kinase I in cells or tissues. It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PCTAIRE protein kinase I DNA. This sequence is used to illustrate the method of the invention Sequence 20 BP; 4 A; 7 C; 6 G; 3 T; 0 U; 0 Other;

The invention relates to antisense compounds, compositions and methods for modulating the expression of PCTAIRE protein kinase 1 (also known as PCTAIRE-1, PTCK1 and crk5). The antisense oligonucleotide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinase 1, particularly a hyperproliferative disease or a meurological disease. These diseases include thrombocytopaenia, mental retardation, Wiskott-Aldrich syndrome, retinitis pigmentosa, dystonia with Parkinsonism, sideroblastic anaemia, X-linked Charcot-Marie-Tooth

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for modulating the expression of PCTAIRE protein Kinase 1 (also known as PCTAIRE-1, PTCK1 and CXE). The antisense oligomuclectide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinase 1, particularly a hyperproliferative disease or a neurological disease. These diseases include thrombocytopaenia, mental retardation, Wiskott-Aldrich syndrome, retinitis pigmentosa, dystonia with Parkinsonism, sideroblastic anaemia, X-linked Charcot-Marie-Tooth disease, or incontinentia pigmenti. The antisense oligomuclectide is particularly useful for inhibiting the expression of PCTAIRE protein kinase 1 in cells or tissues. It is useful for disgnostics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligomuclectide targetted to human PCTAIRE protein kinase 1 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides for modulating PCTAIRE protein kinase 1 gene expression, particularly useful for treating hyperproliferative or neurological disorders for example, mental retardation, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to antisense compounds, compositions and methods

The invention relates to antisense compounds, compositions and methods for modulating the expression of PCTAIRE protein kinase 1 (also known as PCTAIRE.). PTGKI and CTKS). The antisense oligonuclectide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinase 1, particularly a hyperproliferative disease or a neurological disease. These diseases include thrombocytopaenia, mental retardation, wiskott-Aldrich syndrome, retinitis pigmentosa, dystonia with Parkinsonism, sideroblastic anaemia, X-linked Charcot-Marie-Tooth disease, or incontinentia pigmenti. The antisense oligonuclectide is particularly useful for inhibiting the expression of PCTAIRE protein kinase 1 in cells or tissues. It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonuclectide targetted to human PCTAIRE protein kinase 1 DNA. This

                                                                                                                         The invention relates to antisense compounds, compositions and methods for modulating the expression of PCTAIRE protein kinase I (also known as PCTAIRE-1, PTCKI and crk5). The antisense oligonucleotide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinase 1, particularly a hyperproliferative disease or a neurological disease. These diseases include thrombocytopaenia, mental retardation, Wiskott-Addrich syndrome, retinitis pigmentosa, dystonia with Parkinsoniam, sideroblastic anaemia, x-linked Charcot-Marie-Tooth disease, or incontinentia pigmenti. The antisense oligonucleotide is particularly useful for inhibiting the expression of PCTAIRE protein kinase 1 in cells or tissues. It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PCTAIRE protein kinase 1 DNA. This sequence is used to illustrate the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to antisense compounds, compositions and methods for modulating the expression of PCTAIRE protein kinase 1 (also known as PCTAIRE.). PTCK1 and crk5). The antisense oligonucleotide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinase 1, particularly a hyperproliferative disease or a mental retardation, Wiskott-Addrich syndrome, retinitis pigmentosa, dystonia with Parkinsoniam, sideroblastic anaemia, X-linked Charcot-Marie-Tooth disease, or incontinentia pigmenti. The antisense oligonucleotide is particularly useful for inhibiting the expression of PCTAIRE protein kinase 1 in cells or tissues. It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PCTAIRE protein kinase 1 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides for modulating PCTAIRE protein kinase 1 gene expression, particularly useful for treating hyperproliferative or neurological disorders for example, mental retardation, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     //note= "Phosphorothioate backbone; All cytidines are 5-
methylcytidines"

                                                                                                                                                                                                                                      ö
                disease, or incontinentia pigmenti. The antisense oligonucleotide is particularly useful for inhibiting the expression of PCTAIRE protein kinase I in cells or tissues. It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PCTAIRE protein kinase I DNA. This sequence is used to illustrate the method of the invention

The invention relates to antisense compounds, compositions and methods for modulating the expression of PCTAIRE protein kinase 1 (also known as PCTAIRE-1, PTCK1 and czk5). The antisense oligonuclectide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinase 1, particularly a hyperprofilerative disease or a neurological disease. These diseases include thrombocytopaenia, mental retardation, Wiskott-Addrich syndrome, retinitis pigmentosa, dystonia with Parkinsoniam, sideroblastic anaemia, X-linked Charcot-Marie-Tooth disease, or incontinentia pigmenti. The antisense oligonucleotide is particularly useful for inhibiting the expression of PCTAIRE protein or sessents or incontinentia pigmenti. The partisense oligonucleotide is particularly useful for inhibiting the expression of PCTAIRE protein or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PCTAIRE protein kinase 1 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5

for modulating the expression of PCTAIRE protein kinase 1 (also known as PCTAIRE.), PTCK1 and crk5). The antisense oligonucleoride is useful for treating an animal having a disease oligonucleoride is useful for protein kinase 1, particularly a hyperproliferative disease or a neurological disease. These diseases include thrombocytopaenia, mental retradation, Wiskott-Adrich syndrome, retinitis pigmentosa, dystonia with Parkinsonism, sideroblastic anaemia, X-linked Charcot-Marie-Tooth disease, or incontinentia pigmenti. The antisense oligonucleotide is particularly useful for inhibiting the expression of PCTAIRE protein kinase 1 in cells or tissues. It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PCTAIRE protein kinase 1 DNA. This sequence is used to illustrate the method of the invention compositions and methods The invention relates to antisense compounds,

The antisense oligonuclectide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinase 1, particularly a hyperproliferative disease or a neurological disease. These diseases include thrombocytopaenia, mental retardation, Wiskott-Aldrich syndrome, retinitis pigmentosa, dystonia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides for modulating PCTAIRE protein kinase 1 gene expression, particularly useful for treating hyperproliferative or neurological disorders for example, mental retardation, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 'note = "Phosphorothioate backbone; All cytidines are 5-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
     .,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to antisense compounds, compositions and methods for modulating the expression of PCTAIRE protein kinase 1 (also known as PCTAIRE.1, PTCK1 and crk5). The antisense oligomouleotide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinase 1, particularly a hyperproliferative disease or a neurological disease. These diseases include thrombocytopaenia, mental retardation, Miscott-Aldrich syndrome, retinitis pigmentosa, dystonia with Parkinsonism, sideroblastic anaemia, X-linked Charcot-Marie-Tooth disease, or incontinentia pigmenti. The antisense oligomucleotide is particularly useful for inhibiting the expression of PCTAIRE protein kinase 1 in cells or tissues. It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligomucleotide targetted to human PCTAIRE protein kinase 1 DNA. This

                                                                                                                                                                                                                                       The invention relates to antisense compounds, compositions and methods for modulating the expression of PCTAIRE protein kinase 1 (also known as PCTAIRE.1, PTCK1 and crk5). The antisense oligomucleotide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinase 1, particularly a hyperproliferative disease or a neurological disease. These diseases include thrombocytopaenia, mental retardation, Wiskott-Aldrich syndrome, retinitis pigmentosa, dystonia with Parkinsonism, sideroblastic anaemia, X-linked Charcot-Marie-Toch disease, or incontinentia pigmenti. The antisense oligonucleotide is particularly useful for inhibiting the expression of PCTAIRE protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      kinase 1 in cells or tissues. It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligonucleotide targetted to human PCTAIRE protein kinase 1 DNA. This
